

## Math 546/701I—Exam II

Instructor: Shaoyun Yi

Name: \_\_\_\_\_

(1) [15 points] True/False questions: Determine if each of the following is true or false. In each case, explain your answer in detail or give one counterexample if it is false.

(a) True or False:  $4\mathbf{Z} \cong 8\mathbf{Z}$ .

True. Both are infinite and cyclic.

(b) True or False: Let  $\sigma$  be any permutation in  $S_n$ . Then  $\sigma^2$  must be in  $A_n$ .

True.  $\sigma^2$  can be always written as a product of an even number of transpositions.

(c) True or False: Let  $p$  be a prime number. Then  $\mathbf{Z}_p \times \mathbf{Z}_p \cong \mathbf{Z}_{p^2}$ .

False.  $\mathbf{Z}_{p^2}$  is cyclic but  $\mathbf{Z}_p \times \mathbf{Z}_p$  is not.

(d) True or False: Every subgroup of a non-cyclic group is non-cyclic.

False. For example,  $S_3, \mathbf{Z}_2 \times \mathbf{Z}_2$ .

(e) True or False: Two finite groups are isomorphic if they have the same order.

False. For example,  $\mathbf{Z}_2 \times \mathbf{Z}_4, \mathbf{Z}_2 \times \mathbf{Z}_2 \times \mathbf{Z}_2$ .

- (2) [12 points] Let  $G = \{x \in \mathbf{R} \mid x > 0 \text{ and } x \neq 1\}$ , and define  $*$  on  $G$  by
- $$a * b = a^{\ln b} \quad \text{for all } a, b \in G.$$

In Homework 2 (4), we have already shown that  $(G, *)$  is an abelian group and the identity element is the natural number  $e$ .

Prove that  $(G, *)$  is isomorphic to the group  $\mathbf{R}^\times$  under the standard multiplication.

Define a function  $\phi : \mathbf{R}^\times \rightarrow G$  by  $\phi(y) = e^y$  for all  $y \in \mathbf{R}^\times$ . It is well-defined.

$$\phi(y) = e^y > 0 \text{ and } e^y \neq 1 \text{ since } y \in \mathbf{R}^\times. \text{ That is, } \phi(y) \in G \text{ for all } y \in \mathbf{R}^\times.$$

Moreover, we define  $\phi^{-1} : G \rightarrow \mathbf{R}^\times$  by  $\phi^{-1}(x) = \ln x$  for all  $x \in G$ . ✓

To show that  $\phi$  is one-to-one and onto, we need to verify that  $\phi^{-1}$  is the inverse function of  $\phi$ . In fact, for all  $x \in G$  and all  $y \in \mathbf{R}^\times$ , we have

$$\phi(\phi^{-1}(x)) = \phi(\ln x) = e^{\ln x} = x \quad \text{and} \quad \phi^{-1}(\phi(y)) = \phi^{-1}(e^y) = \ln(e^y) = y.$$

For any two elements  $y_1, y_2 \in \mathbf{R}^\times$ , we have

$$\phi(y_1 \cdot y_2) = e^{y_1 \cdot y_2} = (e^{y_1})^{y_2} = (e^{y_1})^{\ln(e^{y_2})} = e^{y_1} * e^{y_2} = \phi(y_1) * \phi(y_2).$$

This shows that  $\phi$  respects the two operations. Thus,  $\phi$  is an isomorphism.

- (3) (a) **[6 points]** Let  $G$  be a group and let  $g \in G$  be an element of order 100. List all possible powers of  $g$  that have order 5. (Hint: Consider the cyclic subgroup  $\langle g \rangle$  generated by  $g$ .)

For any integer  $k$ , we have  $\langle g^k \rangle = \langle g^d \rangle$  with  $d = \gcd(k, 100)$ . And  $o(g^k) = |\langle g^k \rangle| = |\langle g^d \rangle| = \frac{100}{d} = \frac{100}{\gcd(k, 100)} = 5$ . So,  $\gcd(k, 100) = 20$ . It is equivalent to

$$\gcd\left(\frac{k}{20}, 5\right) = 1 \Rightarrow \frac{k}{20} = 1, 2, 3, 4 \Rightarrow k = 20, 40, 60, 80.$$

- (b) **[6 pts]** Let  $G = \mathbf{Z}_{100}$ . List all possible choice of  $[k]_{100}$  such that  $\langle [k]_{100} \rangle = \langle [15]_{100} \rangle$ .

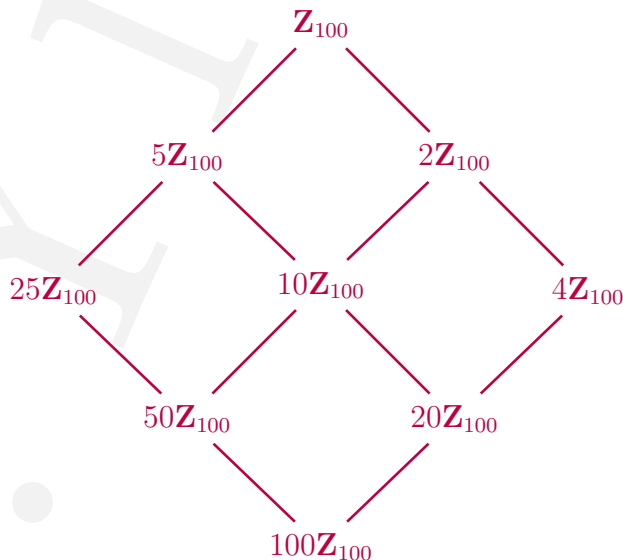

$\langle [k]_{100} \rangle = \langle [15]_{100} \rangle = \langle [5]_{100} \rangle$  since  $\gcd(15, 100) = 5$ . It follows that

$$\langle [k]_{100} \rangle = \langle [5]_{100} \rangle \Leftrightarrow \gcd(k, 100) = 5 \Leftrightarrow \gcd\left(\frac{k}{5}, 20\right) = 1.$$

Thus,  $\frac{k}{5} = 1, 3, 7, 9, 11, 13, 17, 19$ . In conclusion, the possible choices are  $k = 5, 15, 35, 45, 55, 65, 85, 95$ .

- (c) **[6 points]** Give the subgroup diagram of  $\mathbf{Z}_{100}$ .

$100 = 2^2 5^2$ : Any divisor  $d = 2^i 5^j$ , where  $i = 0, 1, 2$  and  $j = 0, 1, 2$ .

(4) [15 points] Recall that  $D_n = \{a^k, a^k b \mid 0 \leq k < n\}$ , where  $a^n = e$ ,  $b^2 = e$ , and  $ba = a^{-1}b$ . Moreover, in Homework 7 (3), we have already shown that  $ba^m = a^{-m}b$  for all  $m \in \mathbf{Z}$ .

(a) [3 points] Show that  $(a^k b)^2 = e$  for each  $0 \leq k < n$ .

$$(a^k b)^2 = (a^k b)(a^k b) = a^k (ba^k) b = a^k (a^{-k} b) b = (a^k a^{-k})(bb) = ee = e.$$

(b) [8 points] Find the order of each element of  $D_{10}$ . (Hint: Use part (a).)

First, we know that  $o(a^k) = \frac{10}{\gcd(k, 10)}$ . Thus,

|       |     |     |       |       |       |       |       |       |       |       |
|-------|-----|-----|-------|-------|-------|-------|-------|-------|-------|-------|
| $a^k$ | $e$ | $a$ | $a^2$ | $a^3$ | $a^4$ | $a^5$ | $a^6$ | $a^7$ | $a^8$ | $a^9$ |
| order | 1   | 10  | 5     | 10    | 5     | 2     | 5     | 10    | 5     | 10    |

It follows from Part (a) that all the remaining elements of the form  $a^k b$  have the order 2 since  $a^k b \neq e$ . That is,

|         |     |      |         |         |         |         |         |         |         |         |
|---------|-----|------|---------|---------|---------|---------|---------|---------|---------|---------|
| $a^k b$ | $b$ | $ab$ | $a^2 b$ | $a^3 b$ | $a^4 b$ | $a^5 b$ | $a^6 b$ | $a^7 b$ | $a^8 b$ | $a^9 b$ |
| order   | 2   | 2    | 2       | 2       | 2       | 2       | 2       | 2       | 2       | 2       |

(c) [4 points] Is  $D_{10}$  isomorphic to  $\mathbf{Z}_4 \times \mathbf{Z}_5$ ? Show work to support your answer.

No.  $\mathbf{Z}_4 \times \mathbf{Z}_5$  is cyclic but  $D_{10}$  is not. Or there is an element of order 4 in  $\mathbf{Z}_4 \times \mathbf{Z}_5$  but  $D_{10}$  has none.
