

Homework 3

Due: Feb 9th (Wednesday class)

-
- Please make sure your handwriting is clear enough to read. Thanks.
 - No late work will be accepted.
-

- (1) In the group $GL_2(\mathbf{R})$ under matrix multiplication, find the order of each of the following elements.

(a) $\begin{bmatrix} 1 & -1 \\ 1 & 0 \end{bmatrix}$

$$\begin{bmatrix} 1 & -1 \\ 1 & 0 \end{bmatrix}^2 = \begin{bmatrix} 0 & -1 \\ 1 & -1 \end{bmatrix}, \begin{bmatrix} 1 & -1 \\ 1 & 0 \end{bmatrix}^3 = \begin{bmatrix} 0 & -1 \\ 1 & -1 \end{bmatrix} \begin{bmatrix} 1 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} = -I_2$$

$$\Rightarrow \begin{bmatrix} 1 & -1 \\ 1 & 0 \end{bmatrix}^6 = (-I_2)^2 = I_2. \text{ Thus, the matrix } \begin{bmatrix} 1 & -1 \\ 1 & 0 \end{bmatrix} \text{ has order 6.}$$

It easily follows from the direct computations to see that its order cannot be 4 or 5.

(b) $\begin{bmatrix} 1 & -1 \\ 0 & 1 \end{bmatrix}$

$$\begin{bmatrix} 1 & -1 \\ 0 & 1 \end{bmatrix}^n = \begin{bmatrix} 1 & -n \\ 0 & 1 \end{bmatrix} \text{ for all } n. \text{ Thus } \begin{bmatrix} 1 & -1 \\ 0 & 1 \end{bmatrix} \text{ has infinite order.}$$

- (2) For each of the following groups, find all cyclic subgroups of the group.

(a) $(\mathbf{Z}_8, +_{[8]})$

$$\mathbf{Z}_8 = \langle [1] \rangle = \langle [3] \rangle = \langle [5] \rangle = \langle [7] \rangle \text{ since } \mathbf{Z}_8^\times = \{[1], [3], [5], [7]\}.$$

$$\langle [2] \rangle = \langle [6] \rangle = \{[0], [2], [4], [6]\}$$

$$\langle [4] \rangle = \{[0], [4]\}$$

$$\langle [0] \rangle = \{[0]\}$$

(b) $(\mathbf{Z}_{12}^\times, \cdot_{[12]})$

$$\mathbf{Z}_{12}^\times = \{[1], [5], [7], [11]\} = \{[1], [5], [-5], [-1]\}$$

$$\langle [1] \rangle = \{[1]\}$$

$$\langle [5] \rangle = \{[1], [5]\}$$

$$\langle [7] \rangle = \{[1], [7]\}$$

$$\langle [11] \rangle = \{[1], [11]\}$$

This implies that \mathbf{Z}_{12}^\times is not a cyclic group.

- (3) Find the cyclic subgroup of S_6 generated by the element $(123)(456)$.

$$[(123)(456)]^2 = (123)^2(456)^2 = (132)(465) \text{ since } (123) \text{ and } (456) \text{ are disjoint.}$$

$$[(123)(456)]^3 = (123)^3(456)^3 = (1) \text{ since } (123) \text{ and } (456) \text{ are cycles of length 3}$$

$$\text{Thus, } \langle (123)(456) \rangle = \{(1), (123)(456), (132)(465)\}.$$

(4) Let $G = \text{GL}_3(\mathbf{R})$. Show that

$$H = \left\{ \begin{bmatrix} 1 & 0 & 0 \\ a & 1 & 0 \\ b & c & 1 \end{bmatrix} \right\}$$

is a subgroup of G .

(i) Closure: $\begin{bmatrix} 1 & 0 & 0 \\ a_1 & 1 & 0 \\ b_1 & c_1 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ a_2 & 1 & 0 \\ b_2 & c_2 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ a_1 + a_2 & 1 & 0 \\ b_1 + c_1 a_2 + b_2 & c_1 + c_2 & 1 \end{bmatrix} \in H.$

(ii) The identity matrix $I_3 \in H$ by letting $a = b = c = 0$.

(iii) Inverses: By part (i): $\begin{bmatrix} 1 & 0 & 0 \\ a & 1 & 0 \\ b & c & 1 \end{bmatrix}^{-1} = \begin{bmatrix} 1 & 0 & 0 \\ -a & 1 & 0 \\ -b + ca & -c & 1 \end{bmatrix} \in H.$

(5) Prove that the intersection of any collection of subgroups of a group is again a subgroup.

Let G be a group and H_i be a subgroup of G for $i \in I$. (I is an index set)

Then we need to show that $K = \bigcap_{i \in I} H_i$ is again a subgroup of G .

(a) Take any $a, b \in K \subseteq H_i$, for each i . Then $ab \in H_i$ since H_i is a subgroup. Thus, $ab \in K$ since i is arbitrary.

(b) The identity element $e \in H_i$ for each i , so $e \in K$.

(c) Take any $a \in K \subseteq H_i$, for each i . Then $a^{-1} \in H_i$ since H_i is a subgroup. Thus, $a^{-1} \in K$ since i is arbitrary.

(6) Prove that any cyclic group is abelian.

Let $\langle g \rangle$ be a cyclic group G . For any two elements $a, b \in G$, there exist $m, n \in \mathbf{Z}$ such that $a = g^m$ and $b = g^n$. Thus,

$$ab = g^m g^n = g^{m+n} = g^{n+m} = g^n g^m = ba.$$

(7) Let G be a non-cyclic group of order 8. Prove that $a^4 = e$ for all $a \in G$.

Proof. Since G is not cyclic, it follows from Lagrange's theorem that an element $a \in G$ can have order 1, 2 or 4 since $8 = 2^3$. Hence proved. \square

(8) Let G be a group. The set

$$Z(G) = \{x \in G \mid xg = gx \text{ for all } g \in G\}$$

of all elements that commute with every other element of G is called the **center** of G . Show that $Z(G)$ is a subgroup of G .

(a) If $x, y \in Z(G)$, then $xy \in Z(G)$ since by definition we have

$$(xy)g = x(yg) = x(gy) = (xg)y = (gx)y = g(xy) \text{ for all } g \in G.$$

(b) The identity element $e \in Z(G)$ since $eg = g = ge$ for all $g \in G$.

(c) If $x \in Z(G)$, then $x^{-1} \in Z(G)$. In fact, for all $g \in G$ we have

$$g = eg = (x^{-1}x)g = x^{-1}(xg) = x^{-1}(gx) = (x^{-1}g)x.$$

Thus, $gx^{-1} = x^{-1}g$ for all $g \in G$.

- (9)* Show that if a group G has a unique element a of order 2, then $a \in Z(G)$. (Note that $Z(G)$, the center of G , is defined as in above Question (8).)

Question (9) is a bonus question. It is optional for the students who are in Math 546. However, it is required for the students who are in Math 701I.*

To show $a \in Z(G)$, it is equivalent to show that $ab = ba$ for all $b \in G$. Consider the element bab^{-1} for each $b \in G$, since $a^2 = e$ we have

$$(bab^{-1})^2 = (bab^{-1})(bab^{-1}) = bab^{-1}bab^{-1} = ba^2b^{-1} = beb^{-1} = e.$$

We omit the parentheses in the above calculations. There are two possibilities:

- (a) If $bab^{-1} = e$, then $ba = b$. This implies $a = e$. We obtain a contradiction since $o(a) = 2$.
- (b) If $bab^{-1} \neq e$, then $o(bab^{-1}) = 2$. So $bab^{-1} = a$ since the element a is the unique one in G with order 2. This implies $ba = ab$ for all $b \in G$. Thus, $a \in Z(G)$.
